# Remove Behavior Setting Filters to Admin Values

Summary

- Previously, when a user with Admin permissions changed the filter values on a list/view, any users that had not yet adjusted the filters on their own would see the Admin-set filter values.

- This behavior was often confusing to users as they weren't aware that filters had been set so didn't understand why they weren't seeing all results in their lists and views.

- Now, filter values defined by Admin users will not be applied to any other users.

Applicable to

- List and View Filters

Additional notes

- No set up required.

- User-adjusted column widths set on an instance will not be saved upon page refresh.

- User-entered filters on presentation slides will not be saved on page refresh or be present in locked slides or present mode.

Additional notes, continued

- Previously, by selecting the desired chart, Gantt, or report view, users with Admin permissions could define a default section view that other users would see on initial page load. Now, this default can be set from the Settings dialog by selecting an option from the Default View dropdown.
