

160.1-2 & 161.0 Release Notes

19 November 2021

Contents

160.1-2

Issue Resolutions

- No labels in Metric View chart

161.0

Issue Resolutions

- Navigation tree breaks during app upgrade when a template is deleted
- Aggregation of metric columns does not work for Variance
- Chart selector shows in the top-left corner of the window
- Pick List icon set by Business Rule does not update when editability is false

161.0

Enhancements

- Enhanced Edit Layout UX: Distinct Layout modes to configure the section, design the layout, and manage the data
- Auto-height section setting for list, view, rich text & form sections
- Collapse section header white space when no title is present
- Removal of 2-Column Layout
- Page-level filtering on templates and dashboards
- Allow page filters to be used in section header expressions
- toFilter() Function: Ability to resolve values in filter-friendly formats

Enhanced Edit Layout UX

Summary

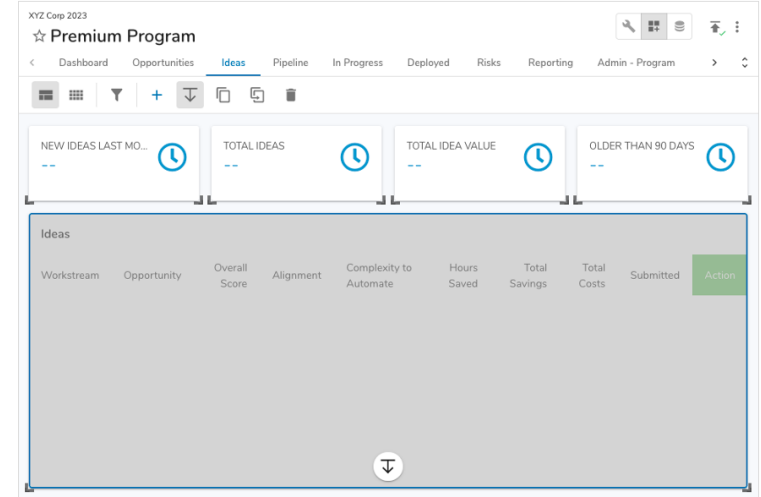

- Previously, App Admins scrolled down to the bottom of a template, dashboard, or presentation and clicked the "Edit Layout" button to modify the layout of a page and to configure sections.
- Now, as part of our continued efforts to upgrade the Shibumi UX, we are providing a more intuitive approach with distinct modes to design page layout and configure sections. These edit modes, along with the previously provided ability to edit data, provide a clear separation of purpose to allow greater design & configuration control.

Applicable to

- Templates, Dashboards, Presentations

Set up

- On a template, toggle between Configure, Layout, and Data modes using the buttons in the upper right corner. Configure mode allows you to configure section settings. Layout mode displays a toolbar at the top of the page with controls to adjust the section density, enable the filter bar, add sections, set sections to auto-height, and duplicate/delete/move sections.
- On a dashboard, click the 3-dot Action menu and select Configure to enable the mode toggle buttons. Select Configure or Layout to edit the dashboard. Select Display to

Set up, continued

- preview the dashboard. Select Finish Configuring from the action menu to hide the mode toggles.
- Similar to dashboards, presentations have 3 modes: Display, Configure, and Layout. Layout controls are enabled when in Layout mode.

Auto-Height Sections

Summary

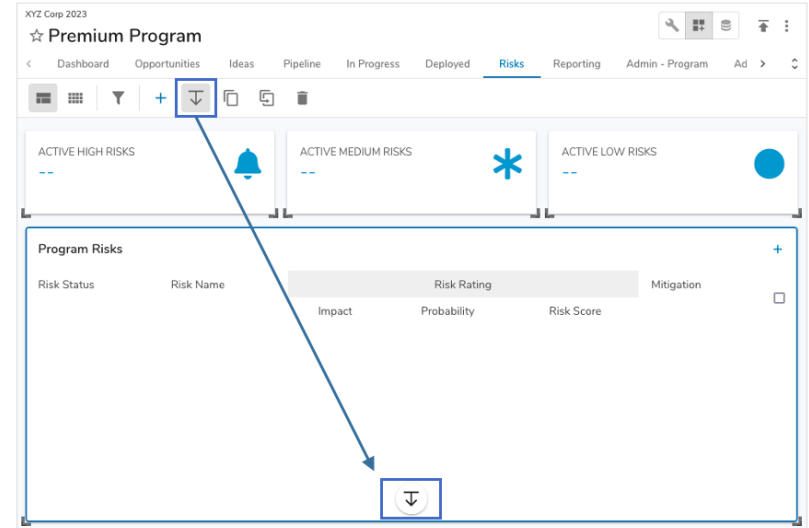

- Previously, sections could only grow in height when the page layout was set to 2-Column layout.
- 2-Column layout did not allow for the same granularity of configuration as other layout options. To have full control, App Admins wanted the auto-height behavior for Standard and Condensed layouts as well.
- Now, we have introduced an auto-height setting for select sections on Standard and Condensed layouts and have retired the 2-Column layout option.

Applicable to

- Lists, Views, Forms, Rich Text sections

Set up

- On a template, dashboards, or presentation, toggle into Layout mode.
- Select a section that should automatically grow/shrink with content.
- Click the auto-height icon in the layout toolbar. An auto-height adornment will appear on the section.
- Note: the height of the section will increase as needed to show all content, but the minimum height of the section will always be as defined on the layout.

Additional notes

- Layouts previously set to 2-Column mode will automatically convert to Condensed layout with auto-height sections.
- If section content shrinks (e.g., is filtered, toggled to a different visualization, etc.), the section height will reduce, but it will not get smaller than the minimum height defined on the layout.

Page-Level Filtering

Summary

- Previously, all filtering was configured at the section-level.
- App Admins wanted to design the page such that all sections reacted to the same filter values.
- Now, page-level filters can be configured on templates and dashboards and tied to sections so all sections respond to the same filters.

Applicable to

- Template Tabs, Dashboards, Tables, Lists, Views

Set up

- On a template tab or dashboard, toggle to Layout mode.
- Click the filter icon in the toolbar to enable the filter bar.
- Click the plus button to add a filter. Select dropdown or date.
- Enter a filter name and optionally edit the API name.
- For a dropdown filter, enter the options to display.
- Use the dynamic filter syntax to tie a section to a filter. For example, in a List/View, enter `{!Filter_API_Name__f}` into a filter field.

The screenshot shows the 'RPA Program 2023' dashboard. The 'Ideas' section is active, displaying a table with columns: Workstream, Opportunity, Overall Score, Alignment, Comp to Auton, Total Costs, Submitted, and Action. A filter dropdown menu is open over the 'Workstream' column, showing options: (Select All), Finance (checked), HR, and Sales & Marketing. The table contains three rows of ideas, all filtered to 'Finance'.

Workstream	Opportunity	Overall Score	Alignment	Comp to Auton	Total Costs	Submitted	Action	
Finance	Strengthen Reviewing and Reconciling Transactions	70%	52%	3 - High	2,880	95,040	0	Jul 18, 2020
Finance	Automate Expense Reimbursements	56%	68%	3 - High	288	10,390	1,450	Jul 6, 2021
Finance	Automate Envelope Mail Out	69%	44%	3 - High	1,680	55,440	0	Aug 1, 2020

Additional notes

- In this initial release, page-level filters can only be applied to Lists, Views, Tables, and Achievement Cards.
- Section titles can also reference page-level filter values using the dynamic reference syntax `{!Filter_API_Name__f}`.

Ability to resolve values into filter-friendly formats

Summary

- Previously, dynamic filters resolved in formats that were not always conducive to filtering. E.g., App Admins wanted numbers to resolve without commas so filtering would not be impacted.
- With the release of page-level filtering, it became even more crucial to provide a way for dynamic values to be formatted properly in section filters.
- Now, a toFilter() function provides the ability to resolve values into filter-friendly formats.

Applicable to

- All locations where expressions can be defined

Syntax

toFilter(value)

- value: The value can be a constant (i.e., hard-coded value, attribute reference, or page-filter reference) and/or references to metrics. The value argument can also be an expression.

Workstream	Opportunity	Overall Score	Alignment	Complexity to Automate	Hours Saved	Total Savings	Total Costs	Submitted	Action
HR	New process improvement idea	78%	76%	2 - Medium	288	28,800	0	Sep 20, 2021	
Finance	Automate Expense Reimbursements	56%	68%	3 - High	288	10,390	1,450	Jul 6, 2021	

Additional notes:

- Multi-select pick lists will resolve selected options surrounded by double quotes and separated by commas.
- Dates will be formatted as "yyyy-MM-dd".
- Numbers will resolve to the raw numeric value without any formatting.
- Text values will be surrounded by double quotes to allow for exact match filtering.

Resolved Issues

Issues

Release		#	Issue
160.2	*	8221	No labels in Metric View chart
161.0	*	7535	Pick List icon set by Business Rule does not update when editability is false
	!	8189	Navigation tree breaks during app upgrade when a template is deleted
	!	7790	Chart selector shows in the top-left corner of the window
	!	5908	Aggregation of metric columns does not work for Variance
